Learn and integrate: Through independent learning and collaborative study, students will attain, use, and develop knowledge in biology, computer science, and related disciplines with specialization in bioinformatics, integrating information across these disciplines. Students will be able to analyze biological datasets to understand living systems.

Think and create: Students will be able to use multiple thinking strategies to examine issues in bioinformatics, including, in particular, the design and computational analysis of biological datasets. Students will be able to apply bioinformatics knowledge to real world challenges, such as those that may be encountered in applied areas, solving problems using creative avenues of expression.

Communicate: Students will be able to acquire and analyze bioinformatics information from the scientific literature. Students will be able to convey bioinformatics information via verbal, written, and other non-verbal methods such as appropriate statistical analyses and graphics.

Clarify purpose and perspective: The program will allow students to explore bioinformatics in the context of their career and life's purpose as well as to apply perspectives to novel issues or problems within bioinformatics or other disciplines to foster an understanding of diverse global perspectives.

Practice citizenship: Students will understand and accept their roles as educated bioinformaticians and scientists in society. Students will be able to communicate with others, including non-scientists, from the special perspective of an educated bioinformatician. Students will be able to apply their understanding of bioinformatics to collaboratively engage with a diverse world.
